Accurately fitting applications for the publication and the access of Horus models

## Everything at a glance – One consistent knowledge base company-wide

The quicker knowledge becomes obsolete, the more critical it will become to ensure that employees and partners are kept continually up-to-date with currently valid information. Incomplete, inaccurate, or contradictory information from site to site or even within a single site can quickly lead to confusion, error-induced loss of income, customer dissatisfaction, customer loss, increased administrative costs; serious communication lapses can even result in legal action.

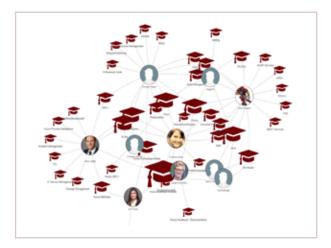

Companies must ensure that all their staff have constant access to the most up-to-date information possible and that they are actively informed of changes that affect their specific work sphere. The information made available to the workforce and to specific groups within it must not only be up-to-date but also identical across the company.

This means that different sites and branches of a company – sometimes distributed all over the world – must share a single, consistent knowledge base. Increasingly, companies with a head-start on the competition are those with a head-start on knowledge management.

## Task-specific knowledge retrieval and transparency at all levels

The challenge is to make enterprise strategies, goals, and processes transparent for all employees, at all levels.

If a company is to procure goods and services, fulfill orders, launch new products successfully, and keep in line with its strategic vision, every employee - regardless of rank - must know what specific contribution they are making to the company's success. The key is to grant every employee easy, trouble free access to the information they need in order to carry out their specific tasks. Finding the relevant information quickly via a pinpoint search has to be as easy as possible. If this is achieved, error rates drop, processes run more smoothly, and output quality improves, even if the usual point of contact for a particular process or task happens to be absent at a crucial time. Valuable knowledge capital that has previously been locked away in the minds of a small number of experts can now be exploited to the fullest, and incorporated into enterprise and process planning.

## HORUS

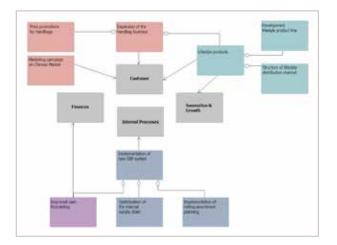

#### **Digital Knowledge Management with Horus**

## Community Portal for all members of the Knowledge Community

The Horus Community Portal is the medium through which the models created using Horus Business Modeler are made available to end users in an enterprise portal. According to the demands of modern knowledge management, these models provide employees with task-oriented, graphic-based, online access to a comprehensive and current snapshot of the objectives, strategies, processes, and knowledge networks of the company as a whole in an easily comprehensible form – accessible from any location and at any time.

#### Wiki-Integration with automated synchronisation workflow for the extension of Horus models

Following a successful release of a Horus model in a company-wide wiki environment, model content can be further supplemented. Back in the Horus Business Modeler, an automatic synchronization process can then be triggered when selecting an appropriate workspace or model.

## Mobile application for location-independent access

With the mobile application to navigate through workspace hierarchies, view models, review properties, drill-down in refinements, and to comment on models the Horus Private Community allows a convenient location-independent access to Horus models at any time.

#### **Commercial Framework**

#### Licensing

Named User (min. 100)

#### Requirements

Horus Business Modeler for writing users, as well as a javascript enabled browser.

#### **Horus Alliance**
