

Knowledge Explorer

Everything at a glance – Comprehensive level of information

The time it takes to implement changes has shortened dramatically. Laws and directives are being modified or newly enacted at an ever faster pace, business models and manufacturing processes are changing in ever shorter periods of time, and new inventions and innovations are setting new standards. These effects are reflected promptly in our day-to-day work. Short response times, high quality levels and competitiveness can only be maintained or improved if information on large and small changes in processes, procedures, standards, instructions and regulations is immediately communicated and implemented.

Target group-specific transparency at all levels

The challenge is to ensure that corporate strategies, goals and processes are transparent throughout the company. In order to carry out orders, implementations and procurements according to plan, each employee must know his or her role in the provision of services. It is crucial that each person has access to the knowledge available in the company in line with their tasks, with little effort on their part. This reduces the error rate and processes function smoothly and in better quality, even if knowledge carriers are not present at the time required.

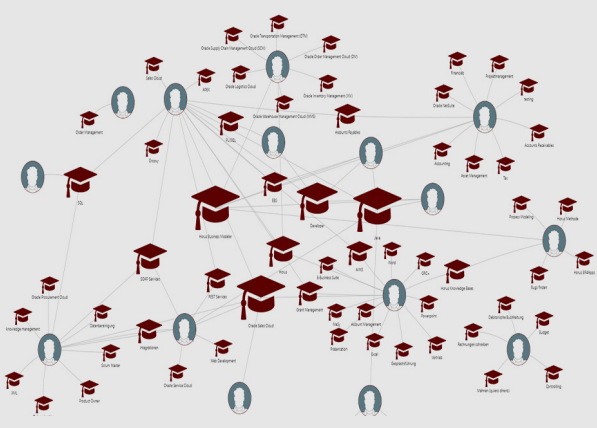

Knowledge Management

Knowledge Portal

A portal for all members of the Horus Knowledge Explorer

The Horus Knowledge Explorer enables all users to access the models created with the Horus Business Modeler in the company portal. In line with the requirements of modern knowledge management, it provides employees with targeted, graphically oriented online access to an always up-to-date and comprehensive depiction of goals, strategies, processes and knowledge contexts in a form they can easily understand – anywhere and at any time.

Digital knowledge management with Horus

After a Horus model has been published in a company-wide Horus environment, model content can be read and studied further. This ensures both a transparent flow of information and active knowledge management within the company.

In the Horus Business Modeler, an automatic synchronization process can then be triggered when a corresponding workspace or model is selected.

A foundation for successful and innovative corporate development

The Horus Knowledge Explorer enables all users of the Knowledge Portal to conveniently access Horus models at any time, regardless of location, navigate through workspace hierarchies, review properties and links, and drill down into refinements. The Horus Knowledge Explorer stands for model-based knowledge and business process management. It is the foundation for an innovative and successful corporate culture through efficient and targeted use of the entire corporate knowledge.
