BP4Apps Project Execution Management

Comprehensive knowledge models for technical structures of the Oracle Project Execution Management Cloud

Support collaborative project planning and project execution

In the business process area of project execution management, companies can configure how to execute projects, including the management of requirements, task scheduling and collaboration, human resources, the maximization of use, problem solving, and the completion of services. Moreover, Project Execution Management enables fast identification of project costs and efficient project cost controlling.

Comprehensive process and application knowledge

With Horus BP4 Project Execution Management, the user or application expert receives an easy-to-use knowledge-based system, which is obtained as a service from the Horus Public Cloud. The Horus Knowledge Explorer provides comprehensive business process knowledge for the relevant Oracle application modules. The access for the users is target group oriented and related to the respective purpose of use. This also applies to the possibilities for invaluable knowledge exchange within the company.

Components of the knowledge product BP4 Project Execution Management

An extensive knowledge base is the core of Horus BP4 Project Execution Management and allows the user a profound insight into the functional structures of Oracle Cloud Applications. This knowledge base consists of easily comprehensible, logically linked models that provide different perspectives on the user-relevant aspects of Oracle Cloud Applications.

The core is formed by models to the following Project Management areas:

- Collaborative project planning
- Project execution
